

Problem-Based Learning

4 days. An open theme. You find the problem.

What is PBL?

You don't get a problem — **you find one.**

You're evaluated on the *process* as much as the outcome.

The Aalborg Model

- Your team chooses its **own problem** within the theme of agentic AI
- You work **collaboratively** in a small group
- The whole workshop is **one project** — from idea to final demo

What to Expect from Your Supervisor

Will:

- Challenge your assumptions with questions
- Ask you to justify design decisions
- Point you to useful resources
- Help you notice when you're overthinking

Won't:

- Choose your problem, or approve/reject it
- Fix your code or solve implementation issues

Before You Start: Agree on Working Norms

- How and when will you communicate during the day?
- How will you resolve disagreements?
- Who helps keep the team moving at a reasonable pace?

Getting Started: Pitching & Teams

- Pitch initial ideas, find others interested in similar problems
- Form a team around a shared area of interest
- Not choosing a final solution yet — just a direction to explore together

Shared Materials to Set Up

- **Problem log** — every problem considered, including discarded ones
- **Project journal** — decisions, research, and progress across all 4 days
- **Shared workspace** — files, notes, screenshots, accessible to everyone

The 4-Day Arc

Day 1 — Explore the Theme, Find Your Problem

- Explore problem space first — resist jumping to a solution
- Log every idea considered, including discarded ones
- Agree on one **Problem Statement**
- Try simple AI tools, no commitment yet
- Write down *why* this problem is worth solving
- Individual reflection

Day 2 — Research & Design

- Research the **problem** (users, why it matters)
- Research the **solution** (tools, frameworks, feasibility)
- Choose your complexity level
- Make and document key design decisions
- Set up your dev environment / workspace
- Individual reflection

Day 3 — Build

- Core functionality first, not every feature you can imagine
- Divide responsibilities — everyone still understands the whole system
- Non-coding contributions matter too: testing, docs, journal, presentation prep
- Capture screenshots/clips as you go
- Individual reflection

Day 4 — Finish, Demo, Retrospective

- Final touches only — fix and stabilize, don't add features
- Present and defend (expect a real Q&A)
- Group retrospective on the whole workshop
- Final individual reflection

How You're Evaluated

Criterion	What it means
Problem	Did you understand it deeply and show it's worth solving?
Solution	Does it address the problem, with justified design choices?
Demo	Did it work, and show the functionality you claimed?
Presentation	Clear, structured, and easy to follow?
Working process	Did you follow PBL — supervisor use, reflections, teamwork?

You have 4 days

From an open theme to a working demo — the ambiguity is intentional.
